SUMMARY

Software engineer with 3+ years of software development experience designing, building, and scaling production systems at CRED — a fintech platform serving 16M users and processing 50M+ credit card statements monthly. Specializes in large-scale distributed systems, LLM agent orchestration, and high-reliability backend infrastructure. Demonstrated technical leadership in challenging over-engineered proposals, debugging complex cross-service failures, and independently driving scalable solutions end-to-end across multi-service architectures.

EDUCATION

B.M.S. Institute of Technology

Bachelor of Engineering, Computer Science and Engineering

Bangalore, India

2022

EXPERIENCE

CRED

April 2024 – Present

Software Engineer (Platform & Infrastructure)

Bangalore, India

- **BBPS Bank Onboarding Agent:** Built an LLM-powered agent that automates bank onboarding onto BBPS — takes a natural language prompt with the bank's biller profile, determines code changes across 5 interdependent microservices, and drives an internal coding agent to implement and raise PRs; onboarded 6 banks (BOI, Bandhan, DCB Edge, ESAF, Jupiter Edge, SBM); reduced a 7-hour process to under 1 hour. Live in production.
- **SLTForge — Service Level Testing Platform:** Built SLTForge from scratch — a reusable SLT framework with WireMock, MySQL, SQS, and Aerospike integrations; extended it with an LLM-powered agent (Claude Code + Daytona) that auto-generates TestNG business-logic test modules and provisions isolated Kubernetes sandboxes on demand; rolled out across 15+ production services org-wide.
- **Statement Service Performance:** Debugged and eliminated redundant upstream API calls in a high-throughput service processing 50M+ monthly statements for 16M users — improving performance by reducing system load 20% and decreasing response latency.
- **Cadence Migration (MySQL → Cassandra):** Identified MySQL scalability bottlenecks in CRED's Cadence workflow engine; debugged a race condition in the GoCQL driver during migration testing — led the version upgrade to resolve it and co-authored the Cassandra-backed migration plan.
- **LLM Config Generator & Developer Tools:** Built an LLM-powered tool to auto-generate JSON parser configs for PDF extraction pipelines (1.5 days → 5 minutes); engineered supporting developer tools, cutting repetitive manual effort by 70%+.
- **MITC Change Detection:** Challenged a proposed always-on scraper microservice — identified bank T&C updates occur ≤ 100 times/year; deployed a reliable n8n workflow comparing SHA hashes of daily-fetched PDFs and routing diffs to Slack, eliminating infrastructure cost entirely.

Software Engineer

March 2023 – March 2024

- Built object-oriented automation frameworks and service-level scripts across 10+ Spring Boot and Dropwizard microservices, enabling scalable, reliable continuous delivery across CRED's distributed financial platform.
- Led Java 8 → 21 service upgrades across production services; contributed shared Cassandra and DB-to-POJO utilities to org-wide QA libraries used across 20+ teams.
- Engineered a large-scale PDF validation system (5,000+ statements/month, 40+ fields) cross-validating raw PDFs against extraction output; contributed to production software development — admin APIs, backfill pipelines, and debugging live issues in high-throughput transaction services.

API Holdings Limited (PharmEasy)

January 2022 – March 2023

Software Engineer

Bangalore, India

- Designed a scalable E2E test automation framework for a real-time home diagnostics platform, increasing test coverage by 30% and cutting manual effort by 50%; debugged cross-service failures via distributed log tracing and led cross-functional root cause analysis in an Agile/CI-CD environment.

Chipster Technologies Pvt. Ltd

August 2021 – January 2022

Software Engineering Intern

Bangalore, India

- Built mobile features using object-oriented design; participated in system design discussions and collaborated cross-functionally with designers to ship production-ready interfaces.

TECHNICAL SKILLS

Languages: Java, Python, C/C++, Dart

Frameworks: Spring Boot, Dropwizard, TestNG

Systems: Distributed Systems, Microservices, REST APIs, Large-scale System Design, Data Pipelines, Scalability, High Reliability

Databases: MySQL, Apache Cassandra

Infrastructure & DevOps: Kubernetes, Docker, AWS, Daytona, Jenkins, CI/CD, Git

AI / LLM: LLM orchestration, autonomous agent design, AI-powered code generation, prompt engineering

Engineering: Object-oriented design, algorithms, debugging, performance optimization, code review, technical leadership
